

CLINICAL REMNANT SAMPLES

FIND HIGH QUALITY, COMPLIANT CLINICAL REMNANT SAMPLES

iSpecimen® provides you with access to more than 25 million clinical remnant samples from laboratory partner sites. Our revolutionary online Marketplace™ connects researchers to a range of human biospecimens available in our healthcare provider partner network – including remnant clinical samples. When samples aren't immediately available, we can collect fresh remnant samples prospectively from our clinical laboratory partners.

ACCESS TO A RANGE OF SPECIMEN TYPES

Whether you need biofluids from patients with specific medical histories, with specific laboratory test results, or from healthy/normal donors, we can help. Biofluids are available across a range of specimen types, including (but not limited to):

Whole Blood	Urine
Plasma	Stool
Serum	CSF
Buffy Coat	Saliva
Nasal, cheek, cervical, and other swabbed material	Sputum

ADVANCING A VARIETY OF RESEARCH PROJECTS

We provide samples to researchers who are developing a wide range of diagnostics: point of care, molecular, drug of abuse, cancer, hematology, autoimmune, hemostasis, infectious disease, and more. Whether you are using low or high throughput diagnostic systems, or testing across one or many biochemical analytes, we can provide biospecimens to meet the needs of your project —however large or small.

SIMPLIFIED COMPLIANCE AND CONTRACTING

iSpecimen simplifies the compliance and contracting process by managing both processes across all of our healthcare provider partners. We ensure that all clinical remnant samples are collected with informed consent, waiver of consent, or under a Non-Human Subject Research determination.

A MARKETPLACE FOR HUMAN BIOSPECIMENS

The iSpecimen Marketplace is your one-stop source for millions of clinical remnant samples, along with banked biofluids, tissue, and viable cells. Advanced search and filtering capabilities allow you to find the exact specimens you need.

CLINICAL REMNANT COLLECTIONS IN ACTION

An in vitro diagnostics company was validating a new instrument and required thousands of clinical remnant samples across hundreds of analytes and ranges—some well outside the normal range. iSpecimen prospectively collected and banked the samples until the company was ready to receive them for testing.
